

Veeva Integration program Assessment - 3

Assessment – 1

Subject: Selenium Automation Testing

Practical Assessment:

1. Write a script to login next generation automation.
Consider a website or web application and our task is to write a test script for a login scenario. The script should demonstrate a generic login process by considering an example website or web application. This can be adapted by replacing the URL and the element locators like username, password with those specific to next generation automation.
2. Write a script to create a browser instance based on browser name.
3. Search the filter list box.
Write a script for a specified option in the list box. The script also implement filtering the list by creating a search bar that hides non-matching items
4. Create a script to open google.com and verify that the title is google and also verify it is redirected to google.co.in

Assessment – 2

Subject – Java Programming

Practical Assessment:

1. Consider storing information of different countries and their capitals. In our problem we deal different types of countries where some countries have only one capital there are countries which have 2 capitals in such a case the capital can be winter capital or summer capital. Summer capital means capital both summer and rainy seasons. There are some countries which have 3 capitals in each season winter summer and rainy. Now store information of n different countries and their capitals and then execute following queries based on request.
 1. Print all countries, no of capitals in each country and corresponding capitals long with the season also.
 2. Given a country name print capitals of the country along with season and no. of capitals for that country.
 3. Print all the countries having 2 capitals.
 4. Print all the countries having 3 capitals.
 5. Find countries that doesn't not contains summer capital.
 6. Find and return capitals of the countries which starts with a vowel.
 7. Print summer capitals of the country that starts with vowel.
2. Several students in a school are waiting to be served there are 2 types of events that can take place
 1. Enter 2. Served
 2. Student having highest CGPA served first.

3. student with the highest priority is served removed from the queue. We assign unique to each student entering the queue. The queue serves the students based on the following priority criteria:
 1. Student having the highest CGPA served first.
 2. Any students having same CGPA will be served by name in ascending case sensitive alphabetical order.
 3. Any students equal CGPA and name will be served in ascending order of the unique ID.

Now the task is to process all the given events and return all the students yet to be served in the priority order.

Example 1: n = 12

Enter John 3.75 50

Enter mark 3.8 24

Enter shafi 3.75 35

Served

Served

Enter Samiha 3.85 36

Served

Enter Ashley 3.9 42

Enter maria 3.6 46

Enter anik 3.95 49

Enter dam 3.96 50

Served

Output: Dam Ashley shafi maria
